

MediFlow Robotics

An Indoor Robotic Delivery Service for Hospitals

Safe, efficient and reliable intra-hospital logistics

Report PDF

1. Hook: the hospital logistics pain point

Hospitals do not only treat patients; they also move thousands of items internally.

- ▶ Medicines, lab samples and supplies move repeatedly between wards, labs and pharmacies.
- ▶ Manual delivery can create delays, weak traceability and interruptions to clinical staff.
- ▶ The business opportunity is not replacing people; it is removing avoidable transport work.

NHS workforce scale and turnover pressure as a background for hospital logistics automation

Workforce scale and turnover pressure provide the background for automation.

2. Solution and value proposition

MediFlow Robotics turns indoor delivery into a managed hospital service.

- ▶ Autonomous robot delivery for medicines, samples, documents and routine supplies.
- ▶ Secure compartments, smart routing, delivery records and remote support.
- ▶ Customer value: reliable, traceable and supported deliveries that fit local hospital workflows.
- ▶ My role in the team: revenue streams, cost structure and commercial alignment.

3. Market, customers and channels

The launch market is niche, but the service is segmented and scalable.

- ▶ **Market:** hospital internal logistics, starting with high-volume hospitals and specialist departments.
- ▶ **Customers:** decision-makers, pharmacy and laboratory teams, logistics teams, IT and frontline staff.
- ▶ **Channels:** direct hospital sales, pilot demonstrations, SPD partner endorsement, on-site deployment and after-sales support.
- ▶ **Buying logic:** hospitals need proof of safety, workflow fit, traceability and support continuity.

Group BMC poster overview

4. Revenue model: value-driven Robot-as-a-Service

Hospitals pay for reliable delivery performance, not only for a physical robot.

- ▶ **Main stream:** monthly or annual robot service subscription.
- ▶ **Deployment stream:** one-off implementation fee for mapping, workflow analysis, training and integration.
- ▶ **Growth stream:** usage-based charges for extra tasks or high-volume operation.
- ▶ **Software stream:** premium modules such as analytics, hospital-system integration and temperature monitoring.
- ▶ **Service stream:** maintenance, battery replacement, repairs and hardware upgrades.
- ▶ Assumed mix in the report: 60% subscription, 15% implementation, 10% usage, 5% premium software, 10% maintenance.

Commercial logic: recurring income supports long-term technical service, while one-off and usage fees cover site-specific complexity.

5. Cost structure: value-driven, not just hardware-driven

The cost base must support a hospital-grade service.

- ▶ Hardware: chassis, sensors, batteries, payload modules and charging docks.
- ▶ Software: navigation, fleet management, remote monitoring and updates.
- ▶ Deployment: mapping, workflow analysis, staff training and integration.
- ▶ Operations: maintenance, spare parts, data protection and safety documentation.

Cost Structure Map

6. Fixed, variable and scalable costs

Scaling makes the business more attractive.

- ▶ Platform development and core engineering salaries are mainly fixed costs.
- ▶ Robot units, sensors, staff training and maintenance increase with each deployment.
- ▶ Scale benefit: one platform can support more hospitals and more delivery scenarios.
- ▶ Scope benefit: the same robot system can cover medicines, samples, linen and documents.

7. Cost-revenue fit and final pitch

A sustainable model links every cost driver to a revenue stream.

- ▶ Hardware and platform costs are recovered through subscription and upgrade fees.
- ▶ Mapping, staff training and integration are recovered through implementation fees.
- ▶ High-volume usage and extra support are recovered through usage-based charges.
- ▶ Maintenance and repair fees protect service continuity and customer trust.
